

I AM: an Autopilot for CIOs, IT and Network Managers

Companies working within a Microsoft Windows environment can benefit from using DMS+Aid to automate and improve management for the provisioning of new Users, Email boxes and network folders. Just imagine a new employee being able to login, have access to their email & folders within seconds of joining your company.

Identity Access Management (IAM) is a method of managing individual identities, roles and privileges within an organisation. An effective IAM implementation can yield nearly 300% ROI over three years. To help you achieve the best ROI possible for your organisation, Vixtro® has developed DMS+Aid, a powerful Identity Access Management solution that can be tailored to meet organisational IT policies.

THE PROCESS

1. ESTABLISH

- Provisioning of new users
- Group membership and appropriate levels of access to resources
- Procedures to be followed when employees leave the organisation

2. CONFIGURE

- Gather data from a variety of sources
e.g. HR / Sales Databases
- One-time Setup
- Centralised Management
- Flexible workflows & processes

3. AUTOMATE

- Secure retrieval of data
- Provision of user accounts, folders, Exchange mailboxes
- Policy enforcement by pre-defined rules and processes

Reduce Help Desk Burden by preventing problems, rather than reacting to them.

Enforcement of user & security policies ensures that users have the correct level of access to resources at all times.

Reduce Risk to your organisation by establishing defined standards and processes around identity management that will be unaffected by technical staff turnover.

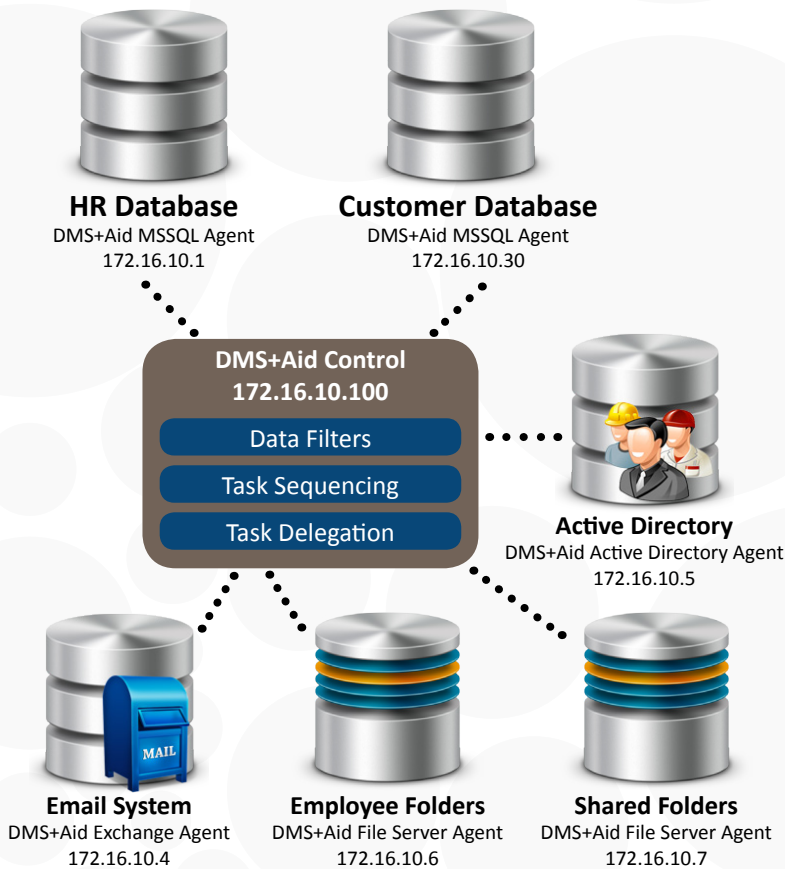

DMS+AID

MANAGEMENT MADE SIMPLE.

Simplified Identity Access Management that saves time and reduces Help Desk traffic.

Updating users in bulk usually comes in two flavours - the 'too hard basket' and 'I need another few days to fix this script'. Scripting is bulky and hard to troubleshoot when something goes wrong, and the user data being passed across the network is rarely secure. DMS+Aid removes all of these concerns. It is easy to use, simple to configure, painless to troubleshoot and securely transfers data from source to destination.

DMS+Aid Control

Overview

DMS+Aid Control is the Agent responsible for coordinating the transfer of data between the other Agents, and controlling the execution of configured tasks. It also has the ability to use 'flat' files, such as CSV and TSV, as data sources.

Data Filters

Data is retrieved from one or more databases and securely transferred to DMS+Aid Control, where it can be manipulated before it is passed to peer Agents.

Task Sequencing

Administrators are able to define their own set of tasks, such as "Create User" or "Modify Folder Permissions", based upon data retrieved by the Data Filters.

Task Delegation

DMS+Aid Control automates the process of assembling tasks configured by the Administrator and delegates them to peer Agents, where they will be executed.

Key Agent Tasks

Active Directory Agent

- Create User Accounts / Groups
- Move / Modify User Accounts
- Modify Group Membership
- Create / Move Organisational Units

Exchange Agent

- Create Mailboxes
- Create Static / Dynamic Distribution Groups
- Modify Distribution Group Membership

File Server Agent

- Create / Move / Delete Folders
- Modify Folder Permissions (ACLs)

MSSQL Agent

- Retrieve data from any number of MSSQL databases
